

# Kanan Board

## Set up

Once you have installed Node.js, follow the steps below to set up and test the app:

1. Clone the app repository from the source code repository at <https://github.com/iliavatafov/Kanban-Board>. You can do this by opening a terminal window and running the command **git clone** <https://github.com/iliavatafov/Kanban-Board.git>.
2. Open the terminal window or suitable IDE, such as VS Code and navigate to the project directory. Then, run the command **npm install** to install the required dependencies for the app.
3. Start the app by running the command **npm start** in the **same directory**. This will automatically launch the app in your browser on port 3000 at <http://localhost:3000>.

With these steps, you should now be able to set up and test the app.

## Tests

To run the tests, execute the command **npm run test**. Please note that if the app is already running in the terminal, it's recommended to open a new terminal window and execute the tests there.
